## 1 Problem 15

Note that

$$\begin{aligned}
 & \sum_{j=0}^n (1 - \frac{j}{n}) \mathbf{X}_{t-j} - \mathbf{Z}_t \\
 &= \sum_{j=0}^n (1 - \frac{j}{n}) (\mathbf{Z}_{t-j} - \mathbf{Z}_{t-j-1}) - \mathbf{Z}_t \\
 &= -\frac{1}{n} (\mathbf{Z}_{t-1} + \mathbf{Z}_{t-2} + \cdots + \mathbf{Z}_{t-n} - n\mathbf{Z}_{t-n-1}) + ((\mathbf{Z}_t - \mathbf{Z}_{t-1}) + (\mathbf{Z}_{t-1} - \mathbf{Z}_{t-2}) \cdots + (\mathbf{Z}_{t-n} - \mathbf{Z}_{t-n-1})) - \mathbf{Z}_t \\
 &= -\frac{1}{n} (\mathbf{Z}_{t-1} + \cdots + \mathbf{Z}_{t-n}).
 \end{aligned}$$

Denote  $\bar{\mathbf{Z}} = \frac{1}{n} (\mathbf{Z}_{t-1} + \cdots + \mathbf{Z}_{t-n})$ , then  $\bar{\mathbf{Z}} \sim N(0, \sigma^2/n)$ . This implies that

$$\lim_{n \rightarrow \infty} \mathbb{E} \left( \sum_{j=0}^n (1 - \frac{j}{n}) \mathbf{X}_{t-j} - \mathbf{Z}_t \right)^2 = \lim_{n \rightarrow \infty} \mathbb{E} (\bar{\mathbf{Z}})^2 = 0.$$

## 2 Problem 16

### 2.1 (a)

We prove by induction. By definition of non-negative definiteness of a complex-valued function, for any complex numbers  $a = (a_1, \dots, a_n)^\top$ , and any  $t_1, \dots, t_n \in \mathbb{Z}$ ,

$$\sum_{j=1}^n \sum_{k=1}^n a_j \bar{a}_k K(t_j - t_k) \geq 0. \quad (*)$$

First, put  $n = 2$ , and  $a = (1, 1)^\top$ . Then  $(*)$  can be written as

$$2 * k(0) + k(-1) + k(1) \geq 0,$$

which means  $\text{Im}g(k(-1)) = -\text{Im}g(k(1))$ . Now put  $a = (1, i)^\top$ , then  $*$  implies that  $\text{Re}(k(-1)) = \text{Re}(k(1))$ , hence  $k(1) = \overline{k(-1)}$ .

Suppose  $k(n) = \overline{k(-n)}$  for  $n = 1, \dots, (m-2)$ . Now we consider when  $n = m$ . Put  $a = (a_1, a_2)^\top$ , where  $a_1 = (1, \dots, 1)^\top$  is  $(m-1)$  by 1 and  $a_2 = (1)$ . We can rewrite  $(*)$  as

$$\begin{aligned}
 & a_1^\top b_1 a_1 + a_2^\top b_3 a_1 + a_1^\top b_2 a_2 + a_2^\top b_4 a_2 \\
 &= a_1^\top b_1 a_1 + b_3 a_1 + a_1^\top b_2 + b_4,
 \end{aligned} \quad (1)$$

where  $b_1$  is  $(m-1)$  by  $(m-1)$  matrix such that  $(i,j)$  component is  $k(i-j)$ , and  $b_2 = (k(-(m-1)), \dots, k(-1))^\top$  and  $b_3 = (k(m-1), \dots, k(1))$  and  $b_4 = k(0)$ . Clearly,  $a_1^\top b_1 a_1 + b_4 \geq 0$  by assumption, so we only consider two terms in the middle in (1), and it gives

$$b_3 a_1 + a_1^\top b_2 = \left( k(1) + k(-1) + \dots + k(-(m-2)) + k(m-2) \right) + k(-(m-1)) + k(m-1) \geq 0.$$

By assumption, we only consider when  $k(-(m-1)) + k(m-1) \geq 0$ , then we have  $\text{Im}g(k(-(m-1))) = -\text{Im}g(k((m-1)))$ .

Similary, put  $a = (a_1, a_2)^\top$ , where  $a_1 = (1, \dots, 1)^\top$  is  $(m-1)$  by 1 and  $a_2 = (i)$  and consider when (\*) is true given assumption  $k(n) = \overline{k(-n)}$  for  $n = 1, \dots, (m-2)$ . Then we have  $\text{Re}(k(-(m-1))) = -\text{Re}(k((m-1)))$ . Combining the two results, we have  $k(m-1) = \overline{k(-m-1)}$ .

## 2.2 (b)

For any  $a = (a_1^\top, a_2^\top)^\top$ , where both  $a_1, a_2$  are  $n$  by 1, (\*) in part (a) can be written as

$$a_1^\top \mathbf{K}_1^{(n)} a_1 + a_2^\top \mathbf{K}_2^{(n)} a_1 - a_1^\top \mathbf{K}_2^{(n)} a_2 + a_2^\top \mathbf{K}_2^{(n)} a_2. \quad (2)$$

By definition of non-negative definiteness,  $a_1^\top \mathbf{K}_1^{(n)} a_1 \geq 0$ , and  $\mathbf{K}_2^{(n)} a_2 + a_2^\top \mathbf{K}_2^{(n)} a_2 \geq 0$ . Therefore (2)  $\geq 0$ , which proves  $\mathbf{L}^{(n)}$  is non-negative definite. Also,

$$K_n = K_1 + iK_2 = K_1^\top - iK_2^\top$$

implies that  $K_1$  is symmetric and  $K_2$  is skew symmetric, so  $L^{(n)}$  is symmetric.

## 2.3 (c)

Note that

$$\begin{aligned} E(W_n W_n^\top) &= E((Y_n + iZ_n)(Y_n + iZ_n)^\top) \\ &= E(Y_n Y_n^\top + Z_n Z_n^\top) + iE(Z_n Y_n^\top - Y_n Z_n^\top) \\ &= \frac{1}{2}(K_1^{(n)} + K_1^{(n)}) + i * \frac{1}{2}(K_2^{(n)} - (-K_2^{(n)})) \\ &= K_1^{(n)} + iK_2^{(n)} = K^{(n)}. \end{aligned}$$

## 2.4 (d)

Let  $F_{t_1, \dots, t_n}$  be a cumulative distribution of  $\left( (Y_1, Z_1), \dots, (Y_n, Z_n) \right)$ , a probability measure on  $(\mathbf{R}^2)^k$ .

1. Since the distribution is normal, for all permutations  $\pi$  of  $\{1, \dots, k\}$  and measurable sets  $F_i \in \mathbf{R}^2$ ,

$$F_{t_{\pi(1)}, \dots, t_{\pi(n)}}(F_{\pi(1)} \times \dots \times F_{\pi(n)}) = F_{t_1, \dots, t_n}(F_1 \times \dots \times F_n).$$

2. For all measurable sets  $F_i \in \mathbf{R}^2, m \in \mathbb{N}$ ,

$$F_{t_1, \dots, t_n}(F_1 \times \dots \times F_n) = F_{t_1, \dots, t_n, \dots, t_{k+m}}(F_1 \times \dots \times F_n \times \underbrace{R^2 \times \dots \times R^2}_m),$$

because marginalization of multivariate normal is still a normal.

With 1. and 2. satisfied, the Kolmogorov extension theorem (also known as Kolmogorov existence theorem, Daniell-Kolmogorov theorem), there exists a probability space  $(\Omega, \mathcal{F}, \mathbb{P})$  and a stochastic process  $X : T \times \Omega \rightarrow \mathbb{R}^2$  such that

$$F_{t_1, \dots, t_n}(F_1 \times \dots \times F_n) = \mathbb{P}(X_{t_1} \in F_1, \dots, X_{t_n} \in F_n)$$

for any finite collection of times  $(t_1, \dots, t_n)$ , which proves the existence of  $\{Y_t\}, \{Z_t\}$ . The theorem says a suitably "consistent" collection of finite-dimensional distributions will define a stochastic process.

## 2.5 (e)

1.

$$E|X_t|^2 = EY_t^2 + EZ_t^2 = \sigma_y^2 + \sigma_z^2 < \infty.$$

2.

$$EX_t = EY_t + i * EZ_t = 0$$

is independent of  $t$ .

3.

$$\gamma_x(h) = EX_{t+h}\bar{X}_t = EY_{t+h}Y_t + EZ_{t+h}Z_t + i * EZ_{t+h}Y_t - i * EZ_tY_{t+h} = K_1(h) + K_2(h)$$

is independent of  $t$ .

## 3 Problem 17

### 3.1 (a)

take derivative of both RHS and LHS with respect to  $t$ , then

$$i \sum_{j=1}^n a_j \lambda_j e^{it\lambda_j} = 0,$$

which means  $\sum_{j=1}^n a_j \lambda_j e^{it\lambda_j} = 0$  for all  $t \in \mathbb{R}$ . Then it must hold that

$$a_j \lambda_j e^{it\lambda_j} = 0$$

for all  $1 \leq j \leq n$ . Since  $\lambda_j$  can take 0 at most 1, so at least  $(n-1)$  elements in  $\{a_1, \dots, a_n\}$  must be 0. If there is one non-zero in  $\{a_1, \dots, a_n\}$ , then we don't satisfy the assumption of the problem so we must have  $a_1 = \dots = a_n = 0$ .

### 3.2 (b)

$\Rightarrow$  We can rewrite  $X_t$  as

$$X_t = (A_1 e^{it\lambda_1} + A_{n-1} e^{it\lambda_{n-1}}) + (\dots) + \dots A_n e^{it\lambda_n}. \quad (1)$$

Since  $A_n$  is real, it is sufficient to show  $(A_j e^{it\lambda_j} + A_{n-j} e^{it\lambda_{n-j}})$  is real. Let  $A_j = a + bi, a, b \in \mathbb{R}$ , and denote  $\theta := t\lambda_j$ , then

$$\begin{aligned} (A_j e^{it\lambda_j} + A_{n-j} e^{it\lambda_{n-j}}) &= (a + bi)(\cos\theta + i\sin\theta) + (a - bi)(\cos\theta - i\sin\theta) = \\ &= C + i(b\cos\theta + a\sin\theta - b\cos\theta - a\sin\theta), C \in \mathbb{R}, \end{aligned}$$

which proves that sum of pairs in (1) are real, hence  $X_t$  is real valued.

$\Leftarrow$

Note that  $\lambda_n = \pi$  but  $\lambda_j$  cannot take  $-\pi$ , so  $\lambda_n$  must be real.

Now,  $\{\lambda_1, \dots, \lambda_{n-1}\}$  must be paired in a way that  $\lambda_j, \lambda_k$  in a pair satisfies  $\lambda_j - \lambda_k = 0$ . But considering the condition  $-\pi < \lambda_1 < \lambda_2 < \dots < \lambda_n = \pi$ , we must have  $\lambda_j = -\lambda_{n-j}$ , so that

$$\exp(it\lambda_j) + \exp(-it\lambda_j) = 2\cos(t\lambda_j) \quad (1)$$

is real because  $\sin(-\theta) = -\sin\theta$ . Then we must have  $A_j = \bar{A}_{n-j}$ .

## 4 Problem 18

If it has a spectral density, then spectral density  $f()$  is even function. Then we have

$$\begin{aligned} F(-\lambda^-) &= \int_{-\pi^+}^{-\lambda^{-1}} f(-x) dx \\ &= \int_{\lambda^+}^{\pi^-} f(x) dx. \end{aligned}$$

Therefore we have

$$F(\lambda) + F(-\lambda^-) = F(\pi^-).$$

## 5 Problem 19

Please see the last pages.

## 6 Problem 20

Suppose there exists some  $n$  such that  $\Gamma_{n-1}$  is not singular but  $\Gamma_n$  is singular. Then there exists linear dependencies and there exist some  $\alpha$  such that  $\gamma(j + (n-1)) = \alpha\gamma(j)$ . Assuming spectral density exists.

$$f_x(\lambda) = \gamma(0) + \frac{1}{\pi} \left( \frac{\sum_{j=1}^{n-2} \gamma(j) * \cos(\lambda * j)}{1 - \alpha} \right)$$

## Problem 19

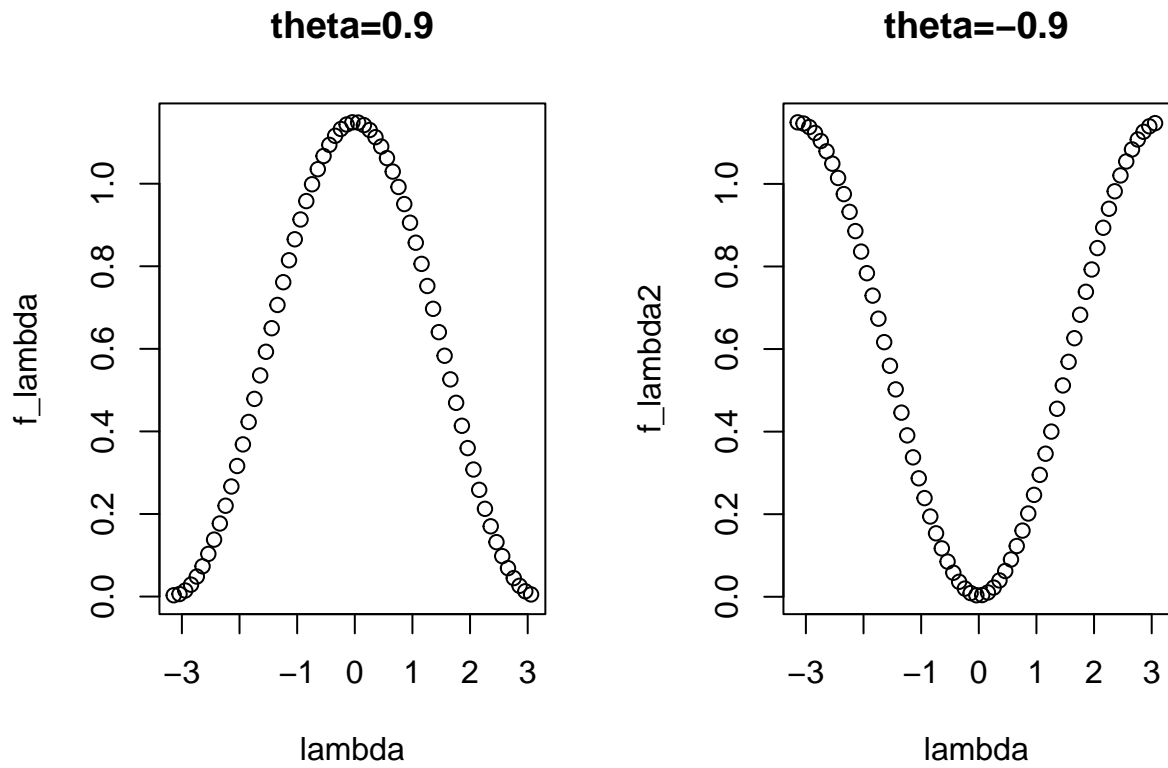

By theorem 4.4.2,

$$f_x(\lambda) = \frac{\sigma^2 |\theta(e^{-i\lambda})|^2}{2\pi |\phi(e^{-i\lambda})|^2}, \quad -\pi \leq \lambda \leq \pi.$$

(a)

$$f_x(\lambda) = \sigma^2 / (2 * \pi) * (1 + 2\theta \cos \lambda + \theta^2).$$

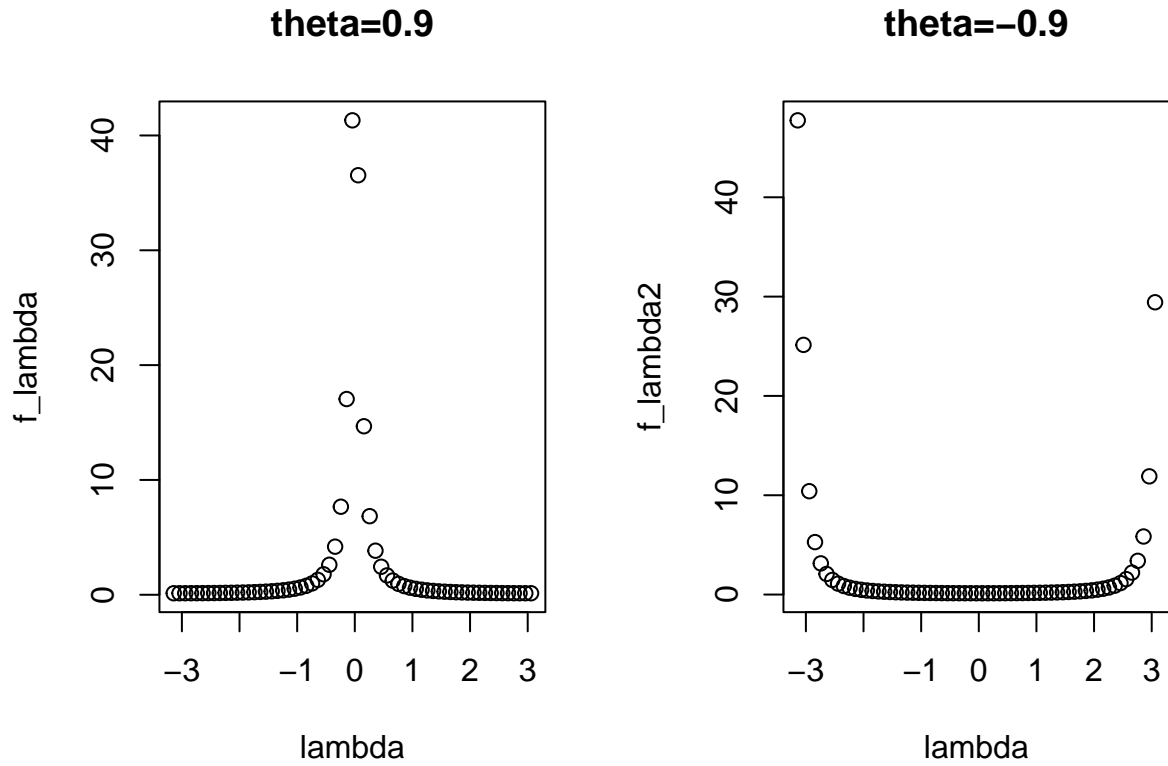

```
par(mfrow=c(1,2))
theta = 0.9
sigma_sq = 2
lambda = seq(-pi,pi, 0.1)
f_lambda = sigma_sq/(2* pi) * (1+ 2 * theta * cos(lambda) + theta^2)
plot(lambda,f_lambda, main="theta=0.9")
theta = -0.9
f_lambda2 = sigma_sq/(2* pi) * (1+ 2 * theta * cos(lambda) + theta^2)
plot(lambda,f_lambda2, main="theta=-0.9")
```

(b)

$$f_x(\lambda) = \sigma^2 / (2 * \pi) * (1 - 2\phi \cos \lambda + \phi^2)^{-1}.$$

```
par(mfrow=c(1,2))
phi = 0.9
sigma_sq = 3
lambda = seq(-pi,pi, 0.1)
f_lambda = sigma_sq/(2* pi) * (1 - 2 * phi * cos(lambda) + phi^2)^{-1}
plot(lambda,f_lambda, main="theta=0.9")
phi = -0.9
f_lambda2 = sigma_sq/(2* pi) * (1 - 2 * phi * cos(lambda) + phi^2)^{-1}
plot(lambda,f_lambda2, main="theta=-0.9")
```

(c)

For AR(3),

$$f_x(\lambda) = \frac{\sigma^2}{2\pi} \left( 2\cos\lambda * (-\phi_1 + \phi_1\phi_2 + \phi_2\phi_3) + 2\cos 2\lambda * (-\phi_2 + \phi_1\phi_3) + 2\cos(3\lambda) * (-\phi_3) + 1 + \phi_1^2 + \phi_2^2 + \phi_3^2 \right)^{-1}$$

and for MA(3),

$$f_x(\lambda) = \frac{\sigma^2}{2\pi} \left( 2\cos\lambda * (\theta_1 + \theta_1\theta_2 + \theta_2\theta_3) + 2\cos 2\lambda * (\theta_2 + \theta_1\theta_3) + 2\cos(3\lambda)\theta_3 + 1 + \theta_1^2 + \theta_2^2 + \theta_3^2 \right)$$

lastly for ARMA(3,2)

$$f_x(\lambda) = \frac{\sigma^2}{2\pi} \left( 2\cos\lambda * (-\phi_1 + \phi_1\phi_2 + \phi_2\phi_3) + 2\cos 2\lambda * (-\phi_2 + \phi_1\phi_3) + 2\cos(3\lambda) * (-\phi_3) + 1 + \phi_1^2 + \phi_2^2 + \phi_3^2 \right)^{-1} * (2\cos(\lambda) * (\theta_1 + \theta_1\theta_2) + 2\cos(2\lambda) * (\theta_2 + \theta_1\theta_3) + 2\cos(3\lambda)\theta_3 + 1 + \theta_1^2 + \theta_2^2 + \theta_3^2)$$

```
library(rootSolve)
fun <- function(x) {1-0.8*x+0.5*x^2+0.2*x^3}
roots = polyroot(c(1, -0.8,0.5,0.2))
```

```
par(mfrow=c(1,3))
theta = c(0.8, -0.5, -0.2)
sigma_sq = 4
lambda = seq(-pi,pi, 0.1)
```

```

tmp2 = ( 2*cos(lambda)*(-theta[1]+theta[1]*theta[2]+theta[2]*theta[3])+
         2*cos(2*lambda) *(-theta[2]+theta[1]*theta[3]) + 2*cos(3*lambda)*(-theta[3]) +
         1 + theta[1]^2+theta[2]^2+theta[3]^2)
f_lambda2 = sigma_sq/(2* pi) * tmp2^{-1}
plot(lambda,f_lambda2, main="AR(3)")

tmp1 = ( 2*cos(lambda)*(theta[1]+theta[1]*theta[2]+theta[2]*theta[3])+
         2*cos(2*lambda) *(theta[2]+theta[1]*theta[3]) + 2*cos(3*lambda)*(theta[3]) +
         1 + theta[1]^2+theta[2]^2+theta[3]^2)
f_lambda = sigma_sq/(2* pi) * tmp1

plot(lambda,f_lambda, main="MA(3)")

theta2 = c(0.5,0.3)
tmp3 = 2* cos(lambda) * (theta2[1]+ theta2[1]*theta2[2]) + 2*cos(2*lambda)*theta2[2]+ 1+ +theta2[2]^2+theta2[1]^2
f_lambda3 = sigma_sq/(2* pi) *tmp2^{-1} * tmp3
plot(lambda,f_lambda3, main="ARMA(3,2)")

```
